

1 Instruction Failure

The agent is told to filter results to "this year only" but misreads the date constraint as a sorting preference and returns all-time results sorted by recency.

"Buy a new wireless headphone under \$200 with the highest rating."

6 Memory Limitations

The long trace overflows the context window; earlier candidate ratings are lost during summarization, causing the agent to pick a suboptimal item it still calls "best".

3 False Assumptions

The agent assumes displayed products are pre-filtered to match the price constraint and selects one that actually exceeds the budget.

4 Planning Error

The agent's sub-plan omits the sorting step; it searches under the default order and selects a low-rated item, mistaking it for the highest-rated.

2 Environmental Failure

The webpage is still loading and shows a temporary banner, but the agent assumes the product list is ready, interacts with stale elements, and receives incorrect or missing data as a result.

5 Catastrophic Forgetting

The "new only" constraint remains in context, but after several navigation steps the agent's attention shifts away from it and a renewed product is added to the cart.

7 History Error Accumulation

A renewed item enters the cart unchecked; the agent then uses it as a reference for price and rating comparisons, and proceeds to checkout without re-validating earlier choices. The single early error silently cascades into a failed task.
